HornSoftTech Technologies professional team specializes in developing enterprise application development and utilizes cutting edge technologies and solutions. We use latest software development technologies and processes. We make sure the software does what the customer wants it to do, have best design and architecture with agility built in, and have high maintainability.

We don't only build the software and leave it to you to deploy, run, and manage it, but we will help you all stages (Consulting, Building, Running, and Managing). Our highest priority is to satisfy the customer through early and continuous delivery of valuable software.

A fifth of the world's population will soon have a *mobile* device and access to the Internet. With that many potential users our mobile application development team will help you to build exciting and practical mobile applications on the Android and iPhone space.

Database applications

HornSoftTech has experience of creating database applications, setting up and using different databases, from small and fast PostgreSQL, MySQL used for small projects, to huge and efficient Oracle database servers with complex structure. We can help you migrate your application from one DBMS to another and if required re-write non-standard code.

Web Services/Service Oriented Architecture

The challenge every company faces is to align business with IT. We are only few IT companies/consultants who think that It is the business that drives the IT not the other way around. We help you to realize the promise of SOA (Service Oriented Architecture) and web service. Our SOA design and architecture will improve your business flexibility, reduce costs, and give you competitive advantage. We are going to work with you to introduce the concept of SOA and the need for technical solutions to your projects,

Integration Application Development

HornSoftTech's Integration work provides best practices and the well-known [Enterprise Integration Patterns](#) while building on the best technologies and products existing for enterprise integration. We enable simple messaging applications and integrate your existing external systems via adapters. Those adapters provide a higher-level of abstraction over heterogeneous protocols and messages. Our integration development team primary goal is to provide a simple solution for your enterprise integration challenges/requirements while maintaining the separation of concerns that is essential for producing maintainable, testable artifacts.

Our highest priority is to satisfy the customer through early and continuous delivery of valuable software.
